

- How does end-user computing help in optimizing end-users in an organization or business?

End-user computing systems are designed to provide users with a consistent computing experience across all of their devices, enabling them to be as active from remote locations as they are at their desks. At the same time, these technologies are meant to make business management simpler while still increasing security. A good end-user computing solution improves the advantages of mobility while mitigating the risks and disadvantages.

- What aspects of end-user computing and development would you consider if you are to make an information system for end-users?

Management, one of the most difficult tasks is managing the tens of thousands of desktops that exist in an enterprise environment. Authorization and modern authentication technology allow businesses to manage access. Educational organizations, nonprofits/NGOs, and government agencies may also take advantage of these types of benefits. Many schools, for example, have taken steps to ensure that students have access to computers during class.

- What possible applications for end-user computing can you think of for a specific organization or business?

Microsoft office suite (Word, Excel, Powerpoint, etc.). Since one of the challenges for a company to tackle is data management, Microsoft Office Suite has provided an opportunity to make it a more convenient and straightforward process. Business owners recognize that one of the ways to succeed in today's dynamic environment is to use technology, with Microsoft Office Suite being one of those requirements.

- How do the concepts/aspects/components from electronic communication systems improve upon a management information system?

Individual workstations, databases, and Internet speed are all dependent on information systems in the business world. Gathering and disseminating information is an important part of management, and information technology can help by helping people to interact more quickly.

- Can the discussed concepts/aspects/components for electronic communication systems be implemented across all possible businesses and/or organizations? How?

To run a successful company, one must invest in high-quality information systems that make it easier to process data and statistics, whether they be organizational or financial in nature. Most enterprises have faced data issues as a result of inaccuracy and reliability, and as a result, workflow has slowed. Any company's primary aim is to reduce human errors and improve productivity. A

organization must have an outstanding information system in order to accomplish those objectives.

- Are there possible risks and/or limitations to consider before implementing electronic communication system concepts/aspects/components?

The lack of contact support is one of electronic communication's flaws. Non-verbal communication, such as tone of voice and body language, may help explain the message you're sending in a face-to-face conversation. Due to a lack of communication support, messages can be misinterpreted.

- How do the concepts/aspects/components from business telecommunications improve upon a management information system?

Telecommunications companies may obtain or generate the data and knowledge they need to better manage current activities, inventory, maintenance issues, and financial accounts; they may also improve long-term planning and the acquisition of government and foreign financing.

- Can the discussed concepts/aspects/components for business telecommunications be implemented across all possible businesses and/or organizations? How?

Telecommunications network can help in accessing the network. Computers that process information are linked with interconnection. They form a channel through which information is transmitted from a sending and receiving device. Equipped with devices that facilitates the transmission of information or control the message transmission over the network.

- Are there possible risks and/or limitations to consider before implementing business telecommunications concepts/aspects/components?

The challenges telecommunications face commonly are: creating a flexible framework to manage both control definition and regulatory requirements with complied measures. From multiple systems, consolidating them along with internal systems, different departments and even third-party content providers and the information security demands due to possible threats relating with internal network.
